Profile

Senior frontend-focused fullstack engineer specializing in complex product interfaces, systems, and developer tooling. Founding engineer with a track record of building 0→1 product development, owning frontend architecture, and shipping AI-powered workflows that convert data insights into automated code execution.

Work Experience

Founding Engineer, *WatchtowerAI*

07/2025 – Present | Remote

- First engineering hire building an AI platform that identifies and remediates inefficiencies across customer data systems
- Owned and defined frontend architecture from scratch, enabling rapid iteration across all product surfaces as the platform scaled from 0→production
- Built an AI-driven remediation system that generates, reviews, and merges pull requests directly from the UI, eliminating large portions of manual debugging and resolution workflows
- Architected AI-driven remediation workflows allowing users to generate, review, and merge pull request fixes directly from the UI, reducing manual debugging and resolution time
- Delivered core product interfaces including AI chat, graph-based data lineage explorer (React Flow), and observability dashboards used to diagnose pipeline failures
- Shipped GitHub App integration powering automated codebase analysis across customer repositories, forming the backbone of the product's execution layer
- Established shared UI component system adopted across internal and customer-facing tools, significantly reducing development time for new features

Frontend Tech Lead, *Default*

12/2023 – 07/2025

- Owned frontend architecture for Workflow Builder, the company's core product for automating inbound sales processes
- Led development of Workflow Builder, enabling customers to design and deploy complex multi-step workflows across their sales stack
- Built full-stack observability and logging system for workflow execution, materially reducing time to diagnose and resolve failures
- Launched AI-based routing system to automatically triage and route inbound leads, reducing manual intervention and improving workflow accuracy
- Worked directly with customers to identify failure points and ship targeted fixes, increasing product reliability and reducing recurring issues

Software Engineer, *Hightouch*

10/2021 – 05/2023

- Built production integrations syncing warehouse data to SaaS tools, enabling reliable data activation across customer systems
- Contributed to Customer Studio, a visual audience builder used by non-technical users to create and trigger data-driven campaigns
- Developed reusable component system powered by JSON configuration, increasing development velocity and consistency across product surfaces
- Contributed to internal UI library used broadly across engineering teams to accelerate feature delivery

Co-Creator, Software Engineer, *Tapestry*

05/2021 – 10/2021

- Built open-source framework enabling developers to deploy end-to-end data pipelines with minimal manual setup
- Automated AWS infrastructure provisioning, eliminating repetitive environment setup and improving deployment consistency
- Designed configuration-driven system to orchestrate ingestion and activation services
- Co-authored technical case study detailing system architecture and implementation

Tech Stack

Languages: TypeScript, JavaScript, SQL

Frontend: React, Next.js, Redux, React Flow

Backend: Node.js, tRPC, GraphQL, REST APIs

Infrastructure: PostgreSQL, AWS, Docker

Specialties: Frontend architecture, developer tooling, AI-integrated workflows, complex UI systems

Education

Harvard University, *Bachelor of Arts - Government*

2009 – 2013
